PACIFIC AND YUKON REGION

ABSTRACT

In 1975 the Water Quality Branch initiated a pilot study on the Peace River from the W.A.C. Bennett Dam to the B.C. - Alberta border. The study was undertaken to provide baseline information on the water quality of the Peace River in B.C. The federal government demonstrated considerable interest in the anticipated developments in the Peace River Watershed through the Mackenzie Basin Intergovernmental Liaison Committee.

In 1975 and 1976 chemical parameters were measured in the water at a total of seven stations. This report presents the chemical data from these collections.

RESUME

En 1975, la Direction de la qualité des eau a entrepris une étude preliminaire de la rivière de la Paix entre le barrage W.-A.-C.-Bennett et la frontière de la Columbie-Britannique et de l'Alberta. Cette étude avait pour but d'acquérir des données sur la qualité des eaux de la rivière de la Paix en Columbie-Britannique. Le gouvernement fédérale s'intéresse de près aux développements prévus dans le bassin hydrographique de la rivière de la Paix, et cela par l'intermédiane du Comité de liaison intergouvernemental du bassin du fleuve Mackenzie.

En 1975 et en 1976, plusieurs paramètres chimiques de l'eau ont été measurés en sept stations différentes. Le présent rapport renferme les résultat de cette étude.

ACKNOWLEDGEMENTS

The help of all those who contributed to this project is gratefully acknowledged. Dr. Annette Smith under DSS Contract No. 095B.KW601-5-9013 compiled and organized the replicate data from the Peace River. Dr. Simon Whitlow and Maureen Lamb of the Water Quality Branch, Ottawa developed a format for water chemistry measurements. Sandy Brown organized the data collected under contract and produced statistics for that set of data.

Mr. Ken Rose from the B.C. Provincial Government, Department of Highways collected samples during freshet of 1976. Mr. F.T.S. Mah and personnel of the Analytical Services Division, Water Quality Branch, Pacific and Yukon Region analyzed the samples and provided precise and timely data.

Mary Lou Haines typed the endless drafts of the report. Dr. L.M. Churchland, Mr. P. Seidl and Mr. J. Temple reviewed the report.

Dr. W.E. Erlebach, Chief of the Water Quality Branch, Pacific and Yukon Region supported the project throughout all the phases of the study.

I. INTRODUCTION

The federal government has, through its participation in the MacKenzie Basin Intergovernmental Liaison Committee, demonstrated an interest in the management of the MacKenzie River Basin. In the mid 1970's several developments including dam construction, coal mining and pipeline construction were anticipated for the watershed of the Peace River, one of the major tributaries to the MacKenzie. Water quality information was necessary in order to evaluate these potential developments.

Therefore the Water Quality Branch initiated a pilot study on the Peace River from the W.A.C. Bennett Dam to the B.C.-Alberta border. This study had two major objectives: 1) to characterize the water quality at several sites on the Peace River and on some of its tributaries, 2) to estimate the variability in selected water quality parameters at the Clayhurst Ferry station.

This report presents data for the Beatton, Pine, Kiskatinaw, and Peace Rivers.

II. STUDY SITES

Water samples were collected at seven sites, including the mainstem of the Peace River and three of its tributaries, (Figure 1), but the major sampling program was confined to five of these sites. Station descriptions and the rationale for site selections are summarized in Table 1.

III. METHODS

A. Sampling Design

The water quality of the Peace River and its tributaries was characterized by collecting samples for nutrients, metals and major ions.

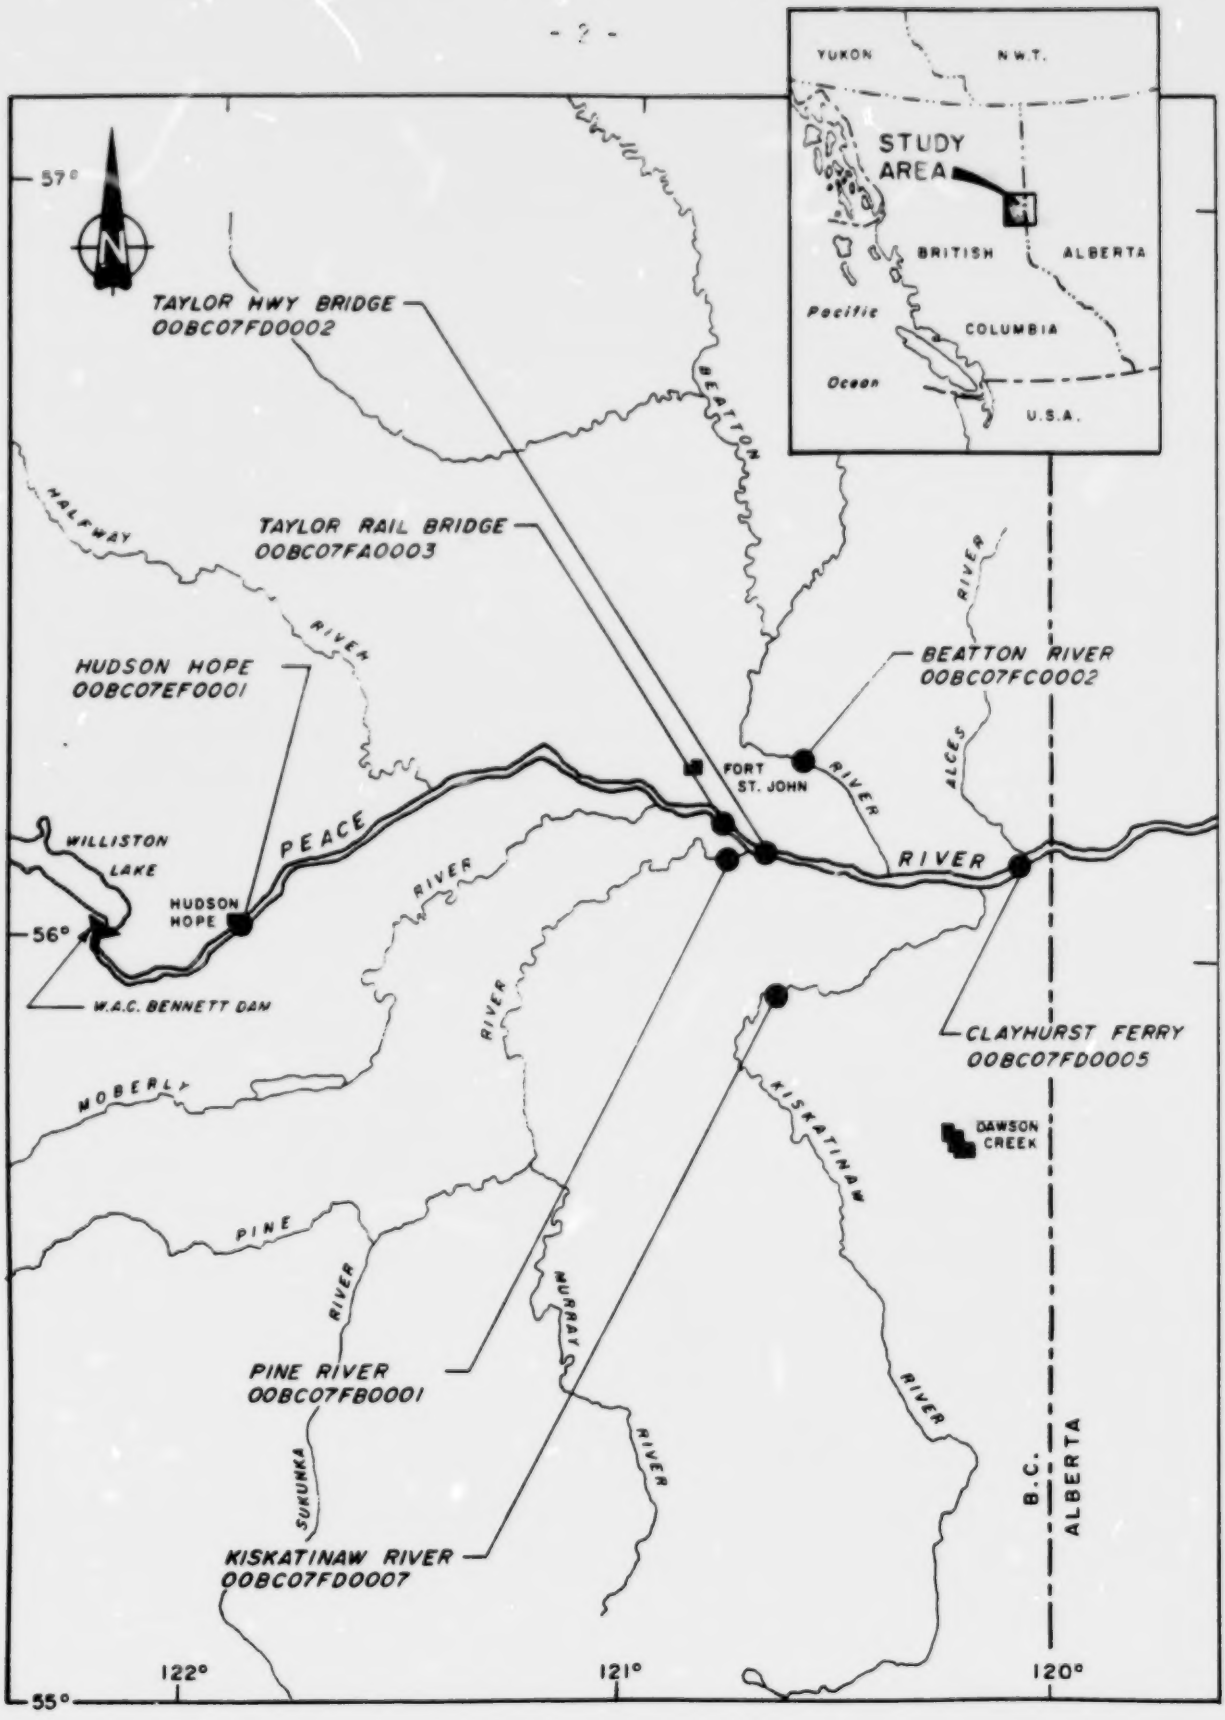

Figure 1 — Water quality stations and NAQUADAT station numbers

TABLE 1

Station locations and descriptions (see Figure 1)

Location (Description)	Selection (Rationale)	Location (Longitude Latitude)	NAQUADAT Station N
Pine River above the confluence			
The Pine River water quality site is located just above the confluence with the Peace River. Coal exploration and mining activities occur in the Murray and Sukunka River basins. The drainage area above the water quality site covers 13,500 square kilometers.	The Pine River site was selected because it drains a major area of the southern Peace River Basin where mining activities are proceeding.	56° 08' 07" N. 120° 42' 46" W.	00BC07FB00(
Peace River at Taylor Railway Bridge			
Samples were taken from the Taylor Railway Bridge just upstream from the Pine River confluence. The drainage area above the water quality site covers 83,900 sq. kilometers. This location does not include input from the Pine River drainage basin.	The Taylor River site was selected to characterize the chemical composition and estimated load for selected parameters for the water coming from Williston Lake and the Halfway River.	56° 09' 42" N. 120° 45' 9" W.	00BC07FA00(
Beatton River, east of Fort St. John			
The Beatton River water quality site is located 9.9 kilometers east of Fort St.John, 31 kilometers from the confluence with the Peace River. The Beatton River drains the agricultural lands on the north side of the Peace River drainage basin below the Taylor water quality site on the Peace River. The drainage area above this water quality site covers 15,500 square kilometers.	This site was selected to characterize the chemical composition and the estimated load for selected parameters from these predominately agricultural lands.	56° 16' 42" N. 120° 42' 5" W.	00BC07FC000

TABLE 1 (Continued)

Location (Description)	Selection (Rationale)	Location (Longitude Latitude)	NAQUADAT Station No.
Kiskatinaw River west of Dawson Creek			
The Kiskatinaw River water quality site is located at the Alaska Highway Bridge near Farmington. The drainage area covers 3,600 square kilometers. The land in the drainage basin is used primarily for agriculture. Grain crops such as barley and wheat are grown in the watershed.	This site represents the quality of waters draining the agricultural lands of the southeastern B.C. portion of the Peace River drainage.	55° 57' 24" N. 120° 33' 45" W.	00BC07FD0007
Peace River upstream of Alces River at Clayhurst Ferry			
This site is located at the Clayhurst Ferry crossing. The drainage area covers 118,000 square kilometers. The water quality in the Peace at this stage represents the inputs from major tributaries to the Peace River in the B.C. portion of the watershed.	This site was selected because it represents the location just before the Peace River crosses the B.C.-Alberta border. It is the last opportunity to characterize the water and to determine the potential loads for certain parameters passing from B.C. to Alberta.	56° 7' 45" 120° 3' 20"	00BC07FD0005
Hudson Hope below W.A.C. Bennett Dam			
The Hudson Hope site is located at the Highway Bridge just below the W.A.C. Bennett Dam. The drainage area upstream of the water quality site is 75,800 square kilometres.	This site was sampled only in May, 1975. It was selected because it drains a major impoundment. The station was dropped to limit sampling sites to those which could be reached in a single day.	57° 1' 37" N. 121° 53' 56" W.	00BC07EF0001
Peace River at Taylor Highway Bridge			
This site is located south of Taylor below the confluence of the Pine River. The drainage area upstream of the water quality site is 97,400 square kilometres.	This site was sampled only in May, 1975. The station was dropped because mixing of Pine and Peace River water was considered incomplete.	56° 10' 0" N. 120° 41' 30"	00BC07FD0002

Sampling was conducted in May, September and October, 1975 and monthly (except April) from March to September, 1976, in order to capture different flow conditions. Hydrometric measurements were not taken at the times samples were collected, but flow data for the Peace River watershed during the study period can be found in Inland Waters Directorate, Water Resources Branch, Surface Water Data, 1975, 1976.

Samples were collected at two or more points on the river cross section at three stations (the Clayhurst Ferry, Taylor Railway Bridge, and Taylor Highway Bridge). At the remaining stations, samples were collected at a single site.

B. Field Sampling Procedures

Samples for determination of nutrients, metals and major ions and physical parameters were collected, preserved as necessary in the field and returned to Vancouver for analysis. Single samples were collected for measurements of major ions and most metals. Replicate samples (usually six) were taken for nutrients and sometimes for iron and manganese. A replicate sampler (Oguss and Erlebach, 1976) was used to collect these samples. A sampling iron (Inland Waters Directorate, Water Quality Branch, 1983) was used to collect 2-L samples for major ions and sediment determinations.

Daily samples for nutrients and iron taken at the Clayhurst Ferry station were collected in triplicate. A modified replicate sampler designed to hold three bottles instead of six was used.

The types of bottles used to collect samples, and the preservation and filtration procedures employed are described in Table 2.

TABLE 2

Field sampling procedures for the water quality parameters.

Parameters which have been grouped and associated with a description were measured from the same bottle.

Parameter	Field Procedures and Sample Preservation
Total Phosphorus	Samples were collected in 50-ml sovirel glass bottles. The bakelite caps had teflon liner inserts to prevent phosphate contamination. Samples were packed in an ice filled cooler.
Dissolved Phosphorus	Samples were collected in 100-ml sovirel glass bottles capped with teflon-lined bakelite caps. Each sample was filtered through a 47-mm Millipore HA (0.45 µm pore diameter) filter which had been pre-soaked in distilled water. The filtering apparatus consisted of a Sartorius polycarbonate filter holder (47 mm diameter, Model SM 165 11). Positive pressure was provided by a hand pump. The filtrate was drained into a 50-ml soivrel glass bottle and packed in ice.
Nitrate plus Nitrite, Ammonia, Total Dissolved Nitrogen, Total Organic Carbon, Total Inorganic Carbon, Particulate Carbon, Particulate Nitrogen	Usually samples were collected in 250 ml polyethylene bottles and immediately packed in ice. In March, 1976, water samples were collected in 1-L polyethylene bottles. Each sample was filtered through a Whatman GF/F glass fiber filter which had been pre-cooked for 6 hours at 460°C. The filtering apparatus consisted of a glass filter holder coupled to a 1-L erlenmeyer flask, both of which had been prewashed in HCL. The vacuum was provided by a hand pump. The filtrate was poured into a 250-ml polyethylene bottle and packed in ice. The filter was transferred to a petri dish and placed in the cooler for the analysis of particulate carbon and particulate nitrogen.

TABLE 2

Parameter	Field Procedures and Sample Preservation
Extractable Metals	
(Ba, Cd, Cu, Fe, Mn, Ni, Pb, Zn)	Samples were collected in 1-L polyethylene bottles which had been pre-washed in chromic acid cleaning solution.* Two milliliters of HNO_3 were added after the samples were collected.
(Fe, Mn)	Replicate samples for Fe and Mn were taken in 250 ml polyethylene bottles. Samples were preserved with .5 ml of HNO_3 per 250 ml.
(As and Se)	Single samples were collected in the main flow at the station sites in 2-L polyethylene bottles. No preservatives were added and aliquots were taken for the analysis of arsenic and selenium.
Dissolved Metals	
(Fe and Mn)	In March of 1976 water samples were collected for Fe and Mn in 250 ml polyethylene bottles using a replicate sampler. Each sample was filtered through a Millipore HA filter which had been pre-soaked in 0.25% HNO_3 for a minimum of 12 hours. The filtering apparatus consisted of a glass filter holder coupled to a 1-L erlenmeyer flask, both of which had been pre-washed in HNO_3. The filtrate was poured into a 250 ml polyethylene bottle and .5 mls of HNO_3 was added.
Major ions, residues and miscellaneous measurements	One 2-L polyethylene bottle was filled with water and aliquots were taken for analysis.

TABLE 2

Parameter	Field Procedures and Sample Preservation
Temperature	Samples usually were collected in 2-L sample bottles. Temperature measurements were taken using a thermometer within fifteen minutes of collection. Occasionally in situ temperature measurements were made.
Phenols	Teflon bottles (either 100 ml or 250 ml) were used to collect the samples. Preservative was added to each bottle in the proportion of 5 ml to each liter of sample water. The preservative had previously been prepared by dissolving 50 gms $CuSO_4 \cdot 5H_2O$ in 150 mls of deionized water. This solution was stirred, and 50 ml of 85% phosphoric acid was added. The solution was made up to 250 mls with deionized water.
Extractable Mercury (Hg)	Samples were collected in 100 ml teflon bottles. The samples were preserved with 1 ml H_2SO_4.
*Chromic acid cleaning solution	Approximately 700 gm of sodium dichromate ($Na_2Cr_2O_7$) was added to 8 liters of distilled water. Then 4 X 2 1/2 liters or 4 winchesters of technical or reagent grade sulphuric acid H_2SO_4 was stirred into solution.

C. Analytical Methods, Filtration and Preservation

The analytical methods used for the parameters measured are described briefly in the NAQUADAT Dictionary (Inland Waters Directorate, Water Quality Branch; 1984) and in detail in the Analytical Methods Manual (Inland Waters Directorate, Water Quality Branch; 1979). The NAQUADAT code number and the associated detection limit for each parameter measured is listed in Table 3.

TABLE 3

NAQUADAT Code Numbers and Limits of Detection for the Chemical Parameters Measured in the Peace River Basin

Parameter	NAQUADAT Number	Detection Limit
Colour	02011	5.0 rel. units
Specific Conductance (Lab)	02041 L	0.2 µsie/cm

TABLE 4

NAQUADAT DETAILED REPORT OF WATER QUALITY DATA FOR THE
MAINSTEM AND SELECTED TRIBUTARIES OF THE PEACE RIVER IN B.C.

Some explanation of the NAQUADAT report format is necessary to help the reader understand this table.

NAQUADAT Code Numbers

All data are tabulated under six-character NAQUADAT codes. The first five characters are always numbers and identify the parameter and analytical method. These code numbers are summarized in Table 3.

Letters following the five digit code are explained below.

F - Field
L - Laboratory
P - Preserved
R - Replicate mean of a number of samples
S - In situ
T - Replicate mean of field - filtered and preserved samples
V - Replicate mean of field - filtered samples
W - Replicate mean of preserved samples

When the five digit code is followed by a number, the number indicates replicate values (eg. 071101 = replicate #1 and 071106 = replicate #6). Replicate values are always preceeded by the replicate means.

When more than one parameter has been measured from a single bottle the sixth character in the code remains the same for all parameters measured from that bottle. For example, nitrate plus nitrite, ammonia, dissolved nitrogen, total organic carbon, and total inorganic carbon were all measured from the same bottle. Thus, parameters 071104, 075574, 076514, 060014, and 060514 were all measured from sample bottle number 4. Table 2 indicates which parameters were measured from the same bottle.

Backup Codes

When the same parameter has been measured by different methods, all data are listed in one column, and the differences are indicated with back-up

codes. For example, extractable iron is usually measured by direct aspiration (26304), but when concentrations are below the detection limit of this method, the samples are reanalyzed using solvent extraction (26305). The NAQUADAT report for iron is as follows:

26304P
Iron
Extractable
.034 05P (solvent extraction)
.60 (direct aspiration)
.042 05W (solvent extraction, replicate mean)

Notations Preceeding Values

The following notations have been used in this report:

L - Less than detection
Q - Mean of replicates which include values less than detection
* - Mean of replicates when samples were measured by two methods (solvent extraction and direct aspiration)

Notes: - Although the boundary between the Pacific and Mountain time zones passes through the study area, all sampling times were recorded as Mountain Standard for continuity.

- Caution is advised in interpreting nonfilterable residues (10401 and 10501) values below 10 mg L^{-1}. Although the detection limit given in Table 3 is 10 mg L^{-1}, the Vancouver laboratory sometimes reports lower values.

Table 5

Variability in concentrations (mg/L) of selected chemicals measured in water samples collected from the Peace River at the Clayhurst Ferry, May 7 - September 21, 1976. "Site" represents points on the cross section: A=10%, B=50%, C=90% of distance from left bank to right bank.

Date	Time	Site	Total Phosphorus	Dissolved NO3 & NO2	Dissolved Ammonia	Total Dissolved Nitrogen	Extrct Iron
